Measurement and commissioning

This guide presents measuring instructions for Swegon's measurable ventilation products.

The products are fitted with commissioning dampers and fixed measurement tappings, suitable for measuring reference pressure in accordance with standard SS-EN 16211:2015, "Air handling - Field methods for measuring air flows".

Product Versions

Presented K-factors refer to the current product version (for discontinued product versions, see older issues of this guide). The product version is indicated by a lower case letter after the upper case product name, for example:

- ALSd (product = ALS, product version = d)
- EAGLE CCa (product = EAGLE Ceiling Circular, product revision = a)

Instructions for measurement – Air diffusers:

- In ducts with fixed flow measurement units, method ID 3 applies.
- For extract air diffusers with fixed measurement tappings, method ET 12 applies.
- For supply air diffusers with fixed measurement tappings, method ST 1 applies. When measurement takes place in the commissioning box's inlet, method ST 11 applies, and when measurement takes place inside the commissioning box via a measurement tapping, ST 12 applies. Here, we distinguish between method ST 121, which relates to measurement via a single pressure socket, and method ST 122, which relates to measurement via two pressure sockets. Easily detachable measuring tubes are installed in the measurement tappings. In certain cases, the measuring tube is connected to a nipple drain with a cover. This cover must be closed when measurement is not being performed.

Procedure for measuring/commissioning – Air diffusers and duct products:

1. Determine the k-factor for the relevant diffuser with the aid of the commissioning guide.
2. Connect a pressure gauge to the measuring tube(s) or nipple drain.
3. One pressure reading, p_i (commissioning pressure), is read on the pressure gauge.
4. The air flow can now be calculated using the equation on the next page.
5. To change the air flow, adjust the damper. In individual products, the air flow is adjusted with plastic plugs or adjustable slots.

When the correct flow/pressure has been achieved, the damper control is locked as follows:

Supply air diffusers:

1. In those cases where the damper control comprises one white and one black nylon cord, the stretched cords must be tied together to create a commissioning knot. In this way, the set damper position can always be indicated.
2. The cords are wound once around the locking screw found in the product.
The damper position is locked by tightening the screw.

Extract air diffusers:

Takes place analogously with the supply air diffuser. In those cases where the diffuser is a control valve, the position of the cone is locked via a lock nut on the rear side of the diffuser.

Duct products (VAV/CAV & commissioning dampers):

On duct products where measurement/commissioning takes place using method ID 3, the damper's knob is fitted with a locking device.

Calculation of airflow – k-factor equations:

There is a specific balancing factor, k-factor, for each measurable Swegon product.

The products are normally marked with a k-factor.

The following equations are used to obtain the actual airflow or the balancing pressure that is valid for the designed airflow.

$$q = k \cdot \sqrt{p_i} \quad (\text{l/s})$$

q = measured airflow (l/s)

p_i = actual balancing pressure (Pa)

k = k-factor

$$p_i = \left(\frac{q}{k} \right)^2 \quad (\text{Pa})$$

p_i = balancing pressure at designed airflow (Pa)

q = designed airflow (l/s)

k = k-factor

If temperature and atmospheric pressure differ from standard settings (20 °C and 1013 mbar) at the time of commissioning, the balancing pressure is recalculated according to the following equation:

$$p_i = p_{i, \text{measured}} \cdot \frac{1,2}{\rho_{\text{time of measurement}}} \quad (\text{Pa})$$

Or the airflow can be recalculated to the standard settings according to:

$$q = q_{\text{measured}} \cdot \sqrt{\frac{1,2}{\rho_{\text{time of measurement}}}} \quad (\text{Pa})$$

Air diffusers with commissioning box ALS

Measurement accuracy and requirement on straight duct before the commissioning box, see Figure 1. The requirements of straight duct depends on the type of disturbance before the commissioning box. Figure 1 shows a bend, a dimensional change and a T-piece. Other types of disturbances requires at least 2xD straight (D = connection dimension) for measurement accuracy of $\pm 10\%$ of the flow.

Figure 1. Example ALS, measurement with one tube according to standard SS-EN 16211:2015 and measurement method ST 121.

Figure 2. Example ALS, measurement with two tubes according to standard SS-EN 16211:2015 and measurement method ST 122.

Measured by pressure gauge.

EXF – k-factor for each size depending on cone position			
Cone position	100	125	160
-15	0,6	1,4	2,0
-10	1,1	2,2	3,1
-5	1,7	3,0	4,0
0	2,2	3,8	4,9
5	2,8	4,9	5,9
10	3,3	5,6	6,8
15	4,5	6,1	7,8

Measured by pressure gauge.

Linear diffusers

SWAN/SWAN Wall-To-Wall

SWAN Ta	SWANa/W-T-Wa – supply air		
Size ^{*)}	1-way	2-way	vertical
2-160	21,0	21,0	18,8
2-200	22,4	22,4	19,8
2-250	23,4	23,4	19,8
3-160	27,1	–	24,9
3-200	29,4	–	25,8
3-250	32,2	–	25,8
4-160	27,6	27,6	25,1
4-200	35,4	35,4	30,8
4-250	39,0	39,0	34,2

Number of measuring tubes: 1

Supply air: Blue

^{*)} First figure indicates the number of slots

SWAN Ta	SWANa/W-T-Wa – extract air
Size ^{*)}	k-factor
2-160	13,0
2-200	16,6
2-250	18,7
3-160	15,8
3-200	19,3
3-250	22,8
4-160	16,7
4-200	22,5
4-250	29,1

Number of measuring tubes: 1

Extract air: Transparent

^{*)} First figure indicates the number of slots

SRY

SRYT 1b	SRYb – supply air			
Size	Size ^{**)}	k-factor	Size ^{**)}	k-factor
1-500-125-L	1-900-1	4,5	1-1200-1	5,3
2-500-160-L	2-900-1	8,6	2-1200-2	6,5
3-500-160-L	3-900-1	12,4	3-1200-2	9,4
4-500-200-L	4-900-1	16,2	4-1200-2	12,4
1-500-125-L	1-1500-2	4,2	1-1800-2	4,6
2-500-160-L	2-1500-2	7,8	2-1800-2	8,6
3-500-200-L	3-1500-2	11,4	3-1800-2	13,0
4-500-200-L	4-1500-2	14,4	4-1800-3	12,4

Note! The K-factor is valid for one commissioning box. Ex: With two or three commissioning boxes for one diffuser, the total of the designed airflow shall be divided by the number of commissioning boxes.

Number of measuring tubes: 1

^{**) Last figure indicates the number of commissioning boxes}

VAV/CAV and commissioning damper

- measurement method ID 31 without damper
 - measurement method ID 32 with damper
- according to standard SS-EN 16211:2015

Figure 9. Example VAV/CAV. Number of measuring tubes: 2. Connected to "nipple well". The K-factor is also valid for the combination VAV with sound attenuator CLA L = 500 or 1000 mm.

REACT V - VAV damper REACT M - Unit of measurement - Circular

Size	REACT Va, REACT Ma
