

# ROC

ROBUST Circular supply and exhaust air terminal

## QUICK FACTS

- Robust design
- Supply or extract air
- Easy wall or ceiling mounting
- Guide vane perforation
- Can be used with commissioning box ALS
- Standard colour White RAL 9003
  - 5 alternative standard colours
  - Other colours upon request

400	315-400	174	626	202	727	234	842

\*)  $L_{p10A}$  = Sound pressure incl. A-filter with 4 dB room attenuation and 10 m² room absorption area.

The data specified in the lower table is applicable to supply air with an open damper when an ALS commissioning box is used.

# Technical description

## Design

The circular perforated supply air terminal consists of two parts, the diffuser box and the diffuser face. The diffuser face has guide vane perforations in a swirl pattern. The diffuser section is attached to the diffuser box using steel pop rivets; which prevents the terminal from being opened.

## Materials and surface treatment

The diffuser face and diffuser box are manufactured in 1,5 mm sheet steel. The complete terminal is powder coated.

- Standard colour:
  - White semi-gloss, lustre 40, RAL 9003/NCS S 0500-N
- Alternative standard colours:
  - Silver gloss, lustre 80, RAL 9006
  - Grey aluminium gloss, lustre 80, RAL 9007
  - White semi-gloss, lustre 40, RAL 9010
  - Black semi-gloss, lustre 35, RAL 9005
  - Grey semi-gloss, lustre 30, RAL 7037
- Non-painted finish and other colours available on request.

## Accessories

### Commissioning box:

ALS: Manufactured of galvanized sheet steel. Includes removable commissioning damper, fixed measurement unit and sound attenuating lining with reinforced surface layer, to Fire Resistance Class B-s1,d0 according to EN ISO 11925-2. Tightness class C on the housing according to SS-EN 12237.

### Planning/Installation

The diffuser box is screwed tightly to the ceiling or the wall. The connecting duct is fixed to the spigot with pop rivets.

When the commissioning box ALS is used, this should be secured to the building structure with drop-rods or installation band. The distance between the commissioning box ALS and the diffuser can be extended by up to 500 mm without the need of extending the measurement hose and damper control. The diffuser face is pop riveted to the diffuser box using steel pop rivets. See Figure 1.

### Commissioning with ALS

Commissioning should be done with the diffuser face assembled. The measurement hose and damper control is pulled out through the perforation of the diffuser face. A manometer is connected to the measurement hose. The desired commissioning pressure can be calculated with the help of the terminal's K-factor. The damper is set in the right position, an adjustment knot is tied on the damper chords to indicate the damper position. To lock the commissioned damper position, the damper cords are fixed with the cord screw in the top part of the diffuser box.

Measurement accuracy and requirement on straight duct before the commissioning box, see Figure 1. The requirements of straight duct depends on the type of disturbance before the commissioning box. Figure 1 shows a bend, a dimensional change and a T-piece. Other types of disturbances requires at least 2xD straight (D = connection dimension) for measurement accuracy of  $\pm 10\%$  of the flow.

The K-factor is stated on the product's label, as well as in the current commissioning instructions, which can be downloaded from [www.swegon.com](http://www.swegon.com). See Figure 1.

### Maintenance

The diffuser is cleaned if necessary with tepid water and a detergent. Access to the duct system is possible by drilling out the steel pop rivets, the diffuser face is then released from its spring clips. When the commissioning box ALS is used, the distribution plate in the box is moved to the side, to gain access to the commissioning damper. The damper unit is then turned anticlockwise and pulled out of its holder.

Figur 1. ROC + ALS.

# Sizing

- Sound pressure level dB(A) applies to rooms with 10 m<sup>2</sup> equivalent sound absorption area.
- Sound attenuation (ΔL) below is shown in the octave band. Orifice attenuation is included in the values.
- Throw length l<sub>0,2</sub> is measured with isothermal supply air temperature.
- Recommended max under temperature is 10 K.

- For calculating the width of the air stream, air velocities in the occupied zone or sound levels in rooms with other dimensions, please refer to our web calculation softwares available for download at [www.swegon.com](http://www.swegon.com).

L<sub>w</sub> = Sound power level

L<sub>p10A</sub> = Sound pressure level dB (A)

K<sub>ok</sub> = Correction for producing the L<sub>w</sub> value in the octave band

L<sub>w</sub> = L<sub>p10A</sub> + K<sub>OK</sub> gives the frequency divided octave band

#### Sound attenuation ΔL(dB)

## Engineering graphs

### Airflow – Pressure drop – Sound level – Throw

- dB(A) applies for a normally attenuated room, 4 dB room attenuation/10 m<sup>2</sup> equivalent room absorption area.
- Throw length  $l_{0,2}$  is measured with isothermal supply air temperature.
- Recommended max under temperature is 10 K.
- For calculating the width of the air stream, air velocities in the occupied zone or sound levels in rooms with other dimensions, please refer to our web calculation softwares available for download at [www.swegon.com](http://www.swegon.com).

- The diagrams show data for diffuser recessed in the ceiling.
- The diagrams should not be used for commissioning.
- ▽ = Min flow to obtain sufficient commissioning pressure.
- dB(A) applies for a normally attenuated room (4 dB room attenuation).
- dB(C) the value normally lies 6-9 dB higher than the dB(A) value.

## Specification example

Swegons reinforced circular terminal type ROCa with commissioning box ALS and the following functions:

- Design in 1.5 mm sheet steel
- Guide vane perforations
- Removable adjustment damper with lockable position
- Measurement function with low method error
- Internal sound attenuating lining with reinforced surface layer
- Powder coated white RAL 9003/NCS S 0500-N
